## Boyles And Charless Law Problems From Book

Solving Volume-Temperature Problems  
 A gas is contained in a cylinder with a movable piston. The gas is initially at a volume of 665 mL and a temperature of 270°C. The gas is then heated to a temperature of 300°C. Assuming the pressure remains constant, what is the final volume of the gas?

Information: The initial volume and temperature and the final temperature are given. In gas law problems, always convert temperatures to Kelvins. The gas law equations do not work for temperatures in degrees Celsius.

Step 1: Convert the initial temperature to Kelvins.  
 $T_1 = 270^{\circ}\text{C} + 273 = 543\text{ K}$

Step 2: Convert the final temperature to Kelvins.  
 $T_2 = 300^{\circ}\text{C} + 273 = 573\text{ K}$

Step 3: Use Charles's Law to solve for the final volume.  

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$\frac{665\text{ mL}}{543\text{ K}} = \frac{V_2}{573\text{ K}}$$

$$V_2 = \frac{665\text{ mL} \times 573\text{ K}}{543\text{ K}}$$

$$V_2 = 698\text{ mL}$$

The final volume of the gas is 698 mL.
